Final Exam

This exam contains 16 pages (including this cover page) and 10 problems. Check to see if any pages are missing. Enter all requested information on the top of this page.

You may *not* use your books, notes, or any calculator on this exam. You are required to show your work on each problem on this exam. The following rules apply:

- You have 180 minutes to complete the exam.
- **If you use a theorem or proposition from class or the notes or the book you must indicate this** and explain why the theorem may be applied. It is okay to just say, “by some theorem/proposition from class.”
- **Organize your work**, in a reasonably neat and coherent way, in the space provided. Work scattered all over the page without a clear ordering will receive very little credit.
- **Mysterious or unsupported answers will not receive full credit.** A correct answer, unsupported by calculations, explanation, or algebraic work will receive no credit; an incorrect answer supported by substantially correct calculations and explanations might still receive partial credit.
- If you need more space, use the back of the pages; clearly indicate when you have done this. Scratch paper is at the end of the document.

Problem	Points	Score

Reference sheet

Below are some definitions that may be relevant.

We say that a sequence of random variables X_1, X_2, \dots **converges in probability** to a random variable X if: for all $\varepsilon > 0$

$$\lim_{n \rightarrow \infty} \mathbf{P}(|X_n - X| > \varepsilon) = 0.$$

We say that a sequence of random variables X_1, X_2, \dots **converges in distribution** to a random variable X if, for any $t \in \mathbf{R}$ such that the CDF of X is continuous at t ,

$$\lim_{n \rightarrow \infty} \mathbf{P}(X_n \leq t) = \mathbf{P}(X \leq t).$$

We say that a sequence of random variables X_1, X_2, \dots **converges in L_2** to a random variable X if

$$\lim_{n \rightarrow \infty} \mathbf{E}|X_n - X|^2 = 0.$$

We say that random variables X_1, X_2, \dots converge **almost surely** (or **with probability one**) to a random variable X if

$$\mathbf{P}(\lim_{n \rightarrow \infty} X_n = X) = 1.$$

Let $\lambda > 0$. Let T_1, T_2, \dots be independent exponential random variables with parameter λ . Let $Y_0 = 0$, and for any $n \geq 1$, let $Y_n := T_1 + \dots + T_n$. A **Poisson Process** with parameter $\lambda > 0$ is a set of integer-valued random variables $\{N(s)\}_{s \geq 0}$ defined by $N(s) := \max\{n \geq 0: Y_n \leq s\}$, $\forall s \geq 0$.

Let X_1, X_2, \dots be independent identically distributed random variables with $\mathbf{E}X_1 = 0$ and $\mathbf{E}|X_1| < \infty$. Let $X_0 := 0$ and for any integer $n \geq 0$, define $S_n := X_0 + \dots + X_n$. We call the sequence of random variables S_0, S_1, \dots a **random walk** started at 0. More generally, if $c \in \mathbf{R}$ is a constant and if $X_0 = c$, we call the sequence of random variables S_0, S_1, \dots a **random walk** started at c .

A **stopping time** for a random walk S_0, S_1, \dots is a random variable T taking values in $0, 1, 2, \dots, \cup \{\infty\}$ such that, for any integer $n \geq 0$, the event $\{T = n\}$ is determined by S_0, \dots, S_n . More formally, for any integer $n \geq 1$, there is a set $B_n \subseteq \mathbf{R}^{n+1}$ such that $\{T = n\} = \{(S_0, \dots, S_n) \in B_n\}$. Put another way, the indicator function $1_{\{T=n\}}$ is a function of the random variables S_0, \dots, S_n .

1. Label the following statements as TRUE or FALSE. If the statement is true, explain your reasoning. If the statement is false, provide a counterexample and explain your reasoning. (In this question, you can freely cite results from the homeworks.)

(a) (3 points) Let A_1, A_2, \dots be subsets of a sample space Ω . Let \mathbf{P} denote a probability law on Ω . Then

$$\sum_{n=1}^{\infty} \mathbf{P}(A_n) = \mathbf{P}(\cup_{n=1}^{\infty} A_n)$$

TRUE FALSE (circle one)

(b) (3 points) Let X be a continuous random variable. Let f_X be the density function of X . Then, for any $t \in \mathbf{R}$, $\frac{d}{dt} \mathbf{P}(X \leq t)$ exists, and

$$\frac{d}{dt} \mathbf{P}(X \leq t) = f_X(t).$$

TRUE FALSE (circle one)

(c) (3 points) Let X be a random variable such that $\mathbf{E}(X^4) < \infty$. Then $\mathbf{E}(X^2) < \infty$.

TRUE FALSE (circle one)

(d) (3 points) Let X be a random variable such that $\mathbf{E}(X^6) = 16$. Then

$$\mathbf{P}(|X| > 2) \leq 1/4.$$

TRUE FALSE (circle one)

- (e) (3 points) Let $i = \sqrt{-1}$. Let X_1, X_2, \dots be random variables such that, for any $t \in \mathbf{R}$,

$$\lim_{n \rightarrow \infty} \mathbf{E} e^{itX_n} = e^{-t^2/2}.$$

Then X_1, X_2, \dots converges in distribution to a standard Gaussian random variable.

TRUE FALSE (circle one)

- (f) (3 points) Let X be a random variable with $\mathbf{E}|X| = 3$. Then

$$\mathbf{P}(X > t) \leq \frac{3}{t}, \quad \forall t \in \mathbf{R}$$

TRUE FALSE (circle one)

- (g) (3 points) Let $\{N(s)\}_{s \geq 0}$ be a Poisson Process with parameter $\lambda = 1$. Then

$$N(4) - N(3), N(3) - N(2), N(2) - N(1), N(1)$$

are all independent random variables.

TRUE FALSE (circle one)

- (h) (4 points) If a sequence of random variables X_1, X_2, \dots converges in distribution to a random variable X , then X_1, X_2, \dots converges in probability to X .

TRUE FALSE (circle one)

- (i) (4 points) If a sequence of random variables X_1, X_2, \dots converges in distribution to a random variable X , then

$$\lim_{n \rightarrow \infty} \mathbf{E}(X_n^2) = \mathbf{E}(X^2)$$

TRUE FALSE (circle one)

2. (10 points) Let X, Y be independent random variables. Suppose X has Fourier Transform

$$\phi_X(t) = e^{-t^2/2}, \quad \forall t \in \mathbf{R}.$$

(Recall that $\phi_X(t) = \mathbf{E}e^{itX}$ where $i = \sqrt{-1}$.) Suppose Y has Fourier Transform

$$\phi_Y(t) = \cos(t), \quad \forall t \in \mathbf{R}.$$

Compute $\mathbf{E}[(X + Y)^2]$.

3. (10 points) Let X be a random variable uniformly distributed on $[0, 1]$.

Let Y be a random variable such that $Y = X$. (Note that Y is uniformly distributed on $[0, 1]$.)

Find the density of $X + Y$.

4. (10 points) Markov's inequality says: for any random variable X with $X \geq 0$, we have

$$\mathbf{P}(X > t) \leq \frac{\mathbf{E}X}{t}, \quad \forall t > 0.$$

Prove Markov's inequality.

5. (10 points) Using the Central Limit Theorem, prove the Weak Law of Large Numbers. (You may assume that X_1, X_2, \dots are independent, identically distributed random variables such that $\mathbf{E}|X_1| < \infty$ and $0 < \text{var}(X_1) < \infty$.)

6. (10 points) Let X_1, X_2, \dots be a Bernoulli process with parameter $p = 1/2$. What is the expected number of trials that have to occur before we see two consecutive “successes”? (Your final answer can be left as an infinite sum of numbers.)

7. (10 points) Let X_1, X_2, \dots be a sequence of independent, identically distributed random variables. Assume that $\mathbf{E}X_1 = 1/2$ and $\text{var}(X_1) = 3/4$.

(i) Compute

$$\lim_{n \rightarrow \infty} \mathbf{P} \left(\frac{X_1 + \dots + X_n}{n} > 1 \right).$$

(ii) For any $n \geq 1$, define

$$Y_n := \frac{X_1^2 + \dots + X_n^2}{X_1 + \dots + X_n}.$$

Does Y_1, Y_2, \dots converge almost surely? If so, what does Y_1, Y_2, \dots converge to almost surely?

8. (10 points) Let X_1, X_2, \dots be a Bernoulli process with parameter $p = 1/2$. Define $N := \min\{n \geq 1: X_n \neq X_1\}$. For any $n \geq 1$, define $Y_n := X_{N+n-2}$. Show that $\mathbf{P}(Y_n = 1) = 1/2$ for all $n \geq 1$, but Y_1, Y_2, \dots is not a Bernoulli process.

9. (10 points) Let X be a random variable such that $|X| \leq 1$, $X \leq 1/2$ and $\mathbf{E}X = 0$.

Is it true that $\mathbf{E}(X^2) \leq 1/4$?

If this inequality is true, prove it. If this inequality is false, provide a counterexample, and justify your reasoning.

10. (10 points) Let $X_0 := x_0 \in \mathbf{Z}$. Let X_0, X_1, \dots be independent random variables such that $\mathbf{P}(X_n = 1) = \mathbf{P}(X_n = -1) = 1/2$ for all $n \geq 1$. Let S_0, S_1, \dots be the corresponding random walk started at x_0 . Let $a, b \in \mathbf{Z}$ such that $a < x_0 < b$. Let $T := \min\{n \geq 1: S_n \in \{a, b\}\}$. Show:

$$\mathbf{P}(S_T = a) = \frac{x_0 - b}{a - b}.$$

(You may assume that $\mathbf{P}(T < \infty) = 1$.)
